

Leading Edge in Fire Safety.

How a Rescue Air System® Is Used in a High Rise Fire Operation

Rescue Air Control Stations/Panels

Lockable interior panels or freestanding fill containment stations that provide firefighters the ability to regulate pressure and to refill SCBA cylinders at predetermined locations throughout the upper floors of the building.

Interconnected-Tubing

Permanently installed stainless steel tubing distributing compressed breathing air to all building-based Rescue Air Control Stations/Panels.

Fire Department Connection Panel

Weather proof, lockable exterior panel that provides firefighters with access to the building-installed Rescue Air System®.

Mobile Air Truck

Mobile system containing the fire department breathing air compressor, which supplies the Rescue Air System® with a constant reliable source of clean dry air.
